1 Measurement Flow

This section describes the measurement flow of the SiRad Evaluation Kit with its most important parameters. The settings as well as the kind and amount of transmitted data can be modified using the SiRad Evaluation Kit communication protocol described in the following sections. The signal flow of the radar measurement is shown in Figure 1. Each measurement cycle is initiated by either an internal 'Self-Trigger' (int) or an external 'Manual Trigger' (ext). Continuous measurements can be triggered with a certain trigger frequency. Once a trigger is received, the PLL is started and drives a frequency ramp from f_{Base} to (f_{Base} + f_{BW}) with the chosen base-frequency (f_{Base}) and the chosen bandwidth (f_{BW}). The radar front end starts its detection in the resulting frequency range. The AD converter (ADC) begins processing the chosen number of data samples (n_{Smp}) with a certain sample frequency (f_{Smp}). The received data is amplified either by a manually set gain value or by a continuously recalculated automatically acquired gain value, further named Auto Gain Control (AGC) Mode. The current measurement is repeated multiple times, for a number N_{Ramps} of frequency ramps, further called set of ramps. Depending on the processing settings, there can be a smaller or larger delay between each ramp in the set of ramps. DC cancellation is performed if activated. The IQ data acquired during each ramp of a set of ramps is summed up. Depending on the processing settings, FIR filtering, down sampling, and windowing are performed on the measurement data and then transformed by an FFT with n_{FFT} points. Magnitude, phase and other information is extracted from the FFT. The output data of a number M_{FFT} of FFTs can be averaged. The targets in the FFT output data are detected by the CFAR operator (with its parameters CFsize, CFguard and CFthres). A target list is then created from the CFAR output and the data extracted from the FFT. The resulting data is always transferred immediately after a measurement took place.

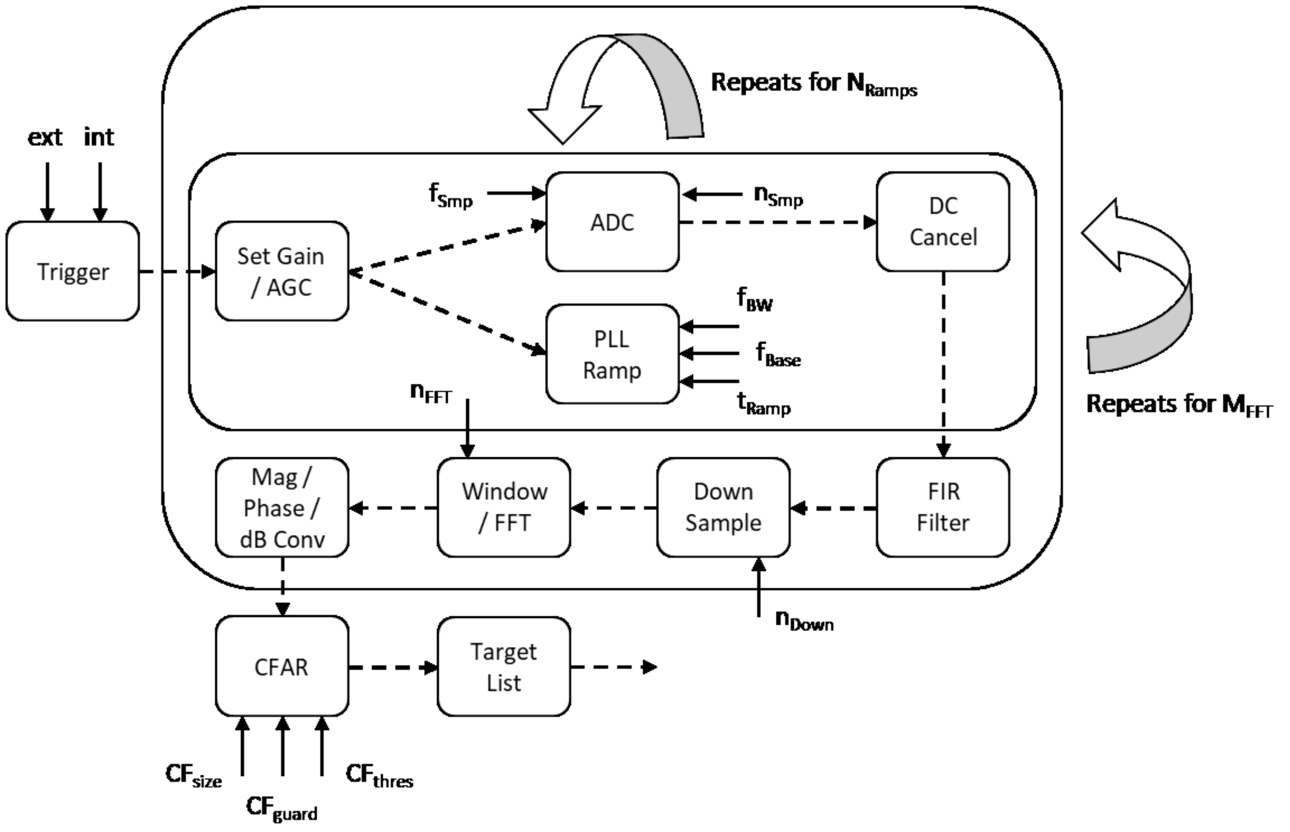

Figure 1 Flow of Radar Measurement on SiRad Evaluation Kits

1.1 Trigger Options

A measurement is divided into two parts: pre-measurement and measurement. The pre-phase is used to detect the optimal gain setting of the system so that no saturation occurs. It uses two frequency ramps to do that (if the Auto Gain Control mode is switched on). After the pre-measurement phase the actual measurement is started and consists of a chosen number of frequency ramps. A measurement can be triggered either manually (externally) or internally via a timer (self-trigger).

When the self-trigger is enabled, the device triggers each measurement after an internal timer expired (and resets the timer). The manual trigger mode is overridden by the self-trigger mode. When the self-trigger mode is disabled, the system enters manual trigger mode and goes to idle until it was triggered externally. After the measurement, the device transmits the data and waits for the next external trigger. This is useful to minimize power consumption of the system when using longer measurement intervals. When using the external trigger options, the pre-trigger can be used to enable the pre-phase before the actual trigger. After the pre-trigger, the system waits for some milliseconds for the main trigger. If the main trigger does not occur within max. 40 ms after the pre-trigger, the system will go back to idle. The pre-trigger option can be also useful to synchronize a number of devices and start their measurements simultaneously or at a defined time.

Table 1 Trigger Input Modes

Trigger Input Mode	Description
Self-trigger	Device triggers itself for measurements; continuous transmission of measurement data
Manual trigger	Device waits for external trigger input for each measurement
Manual trigger with pre-trigger	Device waits for pre-trigger and then for external trigger input for each measurement

Table 2 Trigger Inputs for Manual Trigger and Pre-Trigger

Trigger Input	Description
Trigger button	Blue button on the device
Trigger line	Pin 2 (PC13)
Trigger command	One of !M\r\n, !N\r\n, or !L\\r\n via UART

A ramp trigger output signal is generated on pin 24 (PC4) with each ramp. The trigger signal switches to high with the start of the ramp and to low with the end of the ramp.

Table 3 Trigger Output Modes

Trigger Output Mode	Description
Ramp trigger	Switches to high with the start of the ramp and to low with the end of the ramp

Table 4 Trigger Outputs

Trigger Output	Description
Trigger line	Pin 24 (PC4)

1.2 CFAR Operator

Constant false alarm rate (CFAR) operators are used to calculate an adaptive threshold above the noise floor. Due to the characteristics of usual target spectra, it can be used as an efficient way to achieve a guaranteed detection threshold and reduce false alarms. However, a standard CFAR operator might not be ideal in every target situation or for every application. It should be optimized for the specific measurement task.

2 Supported Protocols

The SiRad Evaluation Kit communicates via UART. The UART protocol is (extended) ASCII based and supports communication to any PC / microcontroller / device that supports the UART settings in Section 2.1 and that implements the communication protocol described in this document. There are three output modes (WebGUI, TSV, binary; explained in Section 4 to 6) but only one way to control the device via input commands, explained in Section 3. The kit supports the Silicon Radar WebGUI for graphical control but also terminal programs, TSV output (Tab Separated Values) for import into Excel / third party software or logging to text files and binary output for faster communication to other microcontrollers or third party software. The kit always starts up with the WebGUI protocol enabled after powering. The output modes can be switched in the WebGUI or using the protocol commands described in this document from a terminal program or a third party control software. The TSV and binary output modes are not supported by the WebGUI.

2.1 UART Settings

This documents applies for firmware version 1.4 or later and is incompatible to firmware version 1.3[1] and below. The following UART settings apply for firmware version 1.4 and later: 1 Mbaud, 8 data bits, 1 start bit, 1 stop bit, no parity, no flow control.

2.2 Software Compatibility

Table 5 Compatibility of WebGUI and Third-Party Software

Protocol	SiRad WebGUI (needs Microsoft Windows)	Terminal programs	Third Party / uC / Own Software
WebGUI	X	X	(X)[2]
TSV	-	X	(X)[3]
Binary	-	X	(X)[4]

2.3 Supported Data Frames per Output Mode

You can find the supported data frames by each protocol in Table 6. Data frames that are not supported by TSV or binary output modes can still be sent while using TSV or binary mode, but the data format of these frames will be in the WebGUI format.

Table 6 Supported Data Frames per Output Mode (WebGUI vs. TSV vs. Binary)

Data Frame	Description	WebGUI	TSV	Binary
ADC raw data frame	Contains ADC raw data (I/Q)	-	X	X
Range frame	Contains distance data extracted from the FFT	X	X	X
Phase frame	Contains phase information extracted from the FFT	X	X	X
CFAR frame	Contains the output of the CFAR operators	X	X	X
Target list frame	Contains the target list with the detected targets	X	X	X
Status update frame	Contains status data updates	X	X	X
Error info frame	Contains basic error information	X	-	X
Detailed error info frame	Contains detailed error information	X	-	-
System info frame	Contains hardware information	X	-	-
Version info frame	Contains hardware and firmware information	X	-	-

---

[1] The baud rate of firmware 1.3 and below is 230400 baud only.

[2] If WebGUI format is implemented.

[3] If data format of tab separated values is supported / implemented.

[4] If binary data format is supported / implemented.

2.4 Terminal Program (Send / Receive)

You can use a terminal program to receive data and send command strings as, for example, shown in Section 2.4 with the terminal program "Realterm" or any other capable terminal program. Put in the UART settings explained in Section 2.1 to the "Port" tab and connect to the kit with "Open". Per default, the kit sends data in the WebGUI output format as shown in Figure 2.

Figure 2 Send and Receive Using a Terminal Program

Calculate command strings by converting the desired command bits into HEX string format. An example command is shown in Figure 3, the resulting HEX string is shown in Figure 4. Use zeros for any RESERVED (grey) fields.

Bit	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1

Binary	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	0	1	1	0	1	1	1	0	1	0

Figure 3 Example: System Configuration Bits Settings

Bit	32	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
SYS_CONFIG	SelfTrigDelay			reserved			LED		reserved							RAW	res	AGC	Gain		SER2	SER1	EXT	ST	TL	P	C	R	DC	res	SLF	PRE
HEX	0				0				0				0				4				9				B				A			

Figure 4 Example: System Configuration in HEX String Format

Add the start marker '!' and the frame identifier to the front of the HEX string command to form the command string. The command formats are explained in Section 3. For the example in Figure 4, you would get the command string

!S000049BA\r\n

Paste the command string into your terminal program and send it to the device. In "Realterm", the command can be pasted into the "Send" tab as shown in Figure 2. Then activate CR and LF, depending on if you already added "\r\n" to the command or not, to let "Realterm" add the stop markers to the string automatically, and then click "Send ASCII".

2.5 Output Mode Configuration (Examples)

Some examples of how to change the output modes are given in the following sub sections.

2.5.1 Change Output Mode and Data from the WebGUI (WebGUI, TSV or Binary)

- Open the Com2WebSocket tool, select 1Mbaud, a correct comport, and connect to the kit
- Open the WebGUI and connect to the WebSocket provided by the Com2WebSocket tool
- (Optional) Set any desired RF, processing and target recognition parameters
- Change to the "Output Data" tab
- Chose the protocol type with the "Protocol Type" slider
- Select the desired output data checkboxes

From that moment on, the kit transmits the selected data frames and it can be disconnected from the WebGUI and the Com2WebSocket tool, if needed.

2.5.2 Change to TSV Output Mode from a Terminal Program

- Find your desired bit settings in the "System Configuration" command, Section 3.3.1
- Set the "Protocol" bits in the "System Configuration" command to "001" (TSV)
- Send the command to the kit

The output should change to the desired output mode.

2.5.3 Change to Binary Output Mode from a Terminal Program

- Find your desired bit settings in the "System Configuration" command, Section 3.3.1
- Set the "Protocol" bits in the "System Configuration" command to "010" (BIN)
- Send the command to the kit

The output should change to the desired output mode.

2.5.4 Activate ADC Raw Data (I/Q) Output from a Terminal Program

- Use the "System Configuration" command settings from 2.5.2 or 2.5.3
- Find your desired bit settings in the "Baseband Configuration" command, Section 0

To enable un-windowed ADC raw data output

- Set the "RAW" bit in the "System Configuration" command
- Unset the "WIN" bit in the "Baseband Configuration" command

To enable windowed ADC raw data output

- Set the "RAW" bit in the "System Configuration" command
- Set the "WIN" bit in the "Baseband Configuration" command

To enable/disable DC cancellation

- Set the "DC" bit in the "Baseband Configuration" command accordingly

Then send both commands to the kit.

2.5.5 Activate Complex FFT Data Output from a Terminal Program

- Use the settings from 2.5.2 or 2.5.3
- Set the "CMP" bit in the "System Configuration" command
- Send the command to the kit

3 Commands (Input)

3.1 Command Frames

Each command frame starts with ASCII value 33 (‘!’) as start marker and ends with two ASCII command characters (‘CR’ and ‘LF’) as stop marker, also see the blue parts in Figure 5. Orange parts indicate data parts (explained later in this section).

3.3 Configuration (Long) Commands

The commands in Table 8 contain data for the configuration of the kit and are explained in the following sections. The configuration commands are available in all output modes.

Table 8 Configuration Commands

Command Frame	Identifier	Answer	Description
System configuration	S	X	Configure basic functions of the system
Radar front end configuration	F	X	Configure front end base-frequency
PLL configuration	P	X	Configure the bandwidth of the frequency ramp
Baseband configuration	B	X	Configure baseband and processing related parameters
Programming mode	W	-	Used to flash SiRad Simple® without hardware configuration

3.3.1 System Configuration

The system configuration command configures basic functions of the system, including triggering, LED, data output, and gain. When the ERR, ST, TL, P, C, R, CPL, or RAW bits are enabled, the according frame will be output after each measurement. Use these bits to switch the transmission of these frames on or off. Switching unnecessary frames off can increase the update rate of the device significantly.

SiRad Easy®	!S01012F82
SiRad Simple® 120 GHz	!S01011F82

Table 10 System Configuration Bits

Format Field	Field Size	Description
SelfTrigDelay	3 bits	Sets a delay time between self-trigger events
LOG	1 bit	Sets scaling type of magnitude data; when set to 0, magnitude data is in dB; **linear scaled magnitude outputs are ONLY useful for TSV or binary output format**
FMT	1 bit	Select the data output format: mm / cm
LED	2 bits	When set to 1st target rainbow, the LED displays the distance of the first recognized target as a color from blue (far) over green (medium range) to red (close). The current maximum range is used as a reference.
Protocol	3 bits	Protocol type for data output: WebGUI, TSV (tab separated values) and binary; **TSV and binary outputs are NOT displayed in the WebGUI**
AGC	1 bit	Auto Gain Control mode: overrides the manual settings in the 'Gain' field. Uses 2 ramps at the beginning of the measurement or the pre-trigger phase for gain measurement (depending on whether 'Pre-trigger' is switched on).
Gain	2 bits	Manual gain setting. Overridden by the AGC bit, which enables Auto Gain Control.
SER1	1 bit	UART-USB connection on the Simple, WIFI or header bar on the SiRad Easy®
SER2	1 bit	USB connection on SiRad Easy®; configuration data can be fed to the device using both UARTs at any time
ERR	1 bit	Enables the Error Information frame
ST	1 bit	Enables the Status Information frame
TL	1 bit	Enables the Target List frame
P	1 bit	Enables the Phase frame
C	1 bit	Enables the CFAR frame
R	1 bit	Enables the Magnitude / Range frame
CPL	1 bit	Enables the Complex FFT data frame; **NOT displayed in the WebGUI**
RAW	1 bit	Enables the ADC raw data (I/Q) frame; **NOT displayed in the WebGUI**
PRE	1 bit	Enable pre-trigger (applies only in manual trigger mode)
SLF	1 bit	Switch between self-trigger and manual trigger

3.3.2 Radar Front End Configuration

The radar front end configuration command configures the start (or base) frequency for the front end. The base frequency can be set in 250 kHz steps. Each front end has a slightly different minimum and maximum operating frequency due to production tolerances. The SiRad Simple® has a fixed 122 GHz front end onboard.

Table 17 Baseband Setup Bits

Format Field	Field Size	Description
WIN	1 bit	Enables Windowing on the samples before performing the FFT
FIR	1 bit	Enables the FIR filter
DC	1 bit	Enables digital de-trending and static offset compensation
CFAR	2 bits	Select the CFAR operator
CFAR Threshold	4 bits	CFAR threshold value added to average of the CFAR operator; value range is 0 to 30 in step size of 2
CFAR Size	4 bits	Number of cells left and right of the CFAR guard interval; value range is 0 to 15
CFAR Guard	2 bits	Number of guard cells left and right of the cell under test; value range is 0 to 3
Average n	2 bits	Selects how many FFTs are averaged
FFT Size	3 bits	Number of FFT points
Down Sample	3 bits	Down sampling factor
#Ramps	3 bits	Number of ramps used for each measurement
#Samples	3 bits	Number of samples used for each measurement
ADC ClkDiv	3 bits	Select the sampling frequency

3.4 Special Function (Short) Commands

The following short commands do not contain any data and perform a single request or action only. They are available in all output modes but their answers are only sent in WebGUI output format. Please see Section 4 for their formats.

Table 18 Special Function Commands

Command Frame	Identifier	Answer	Description
Get detailed error report	E	X	Request detailed error report
Get system info	I	X	Request system info data
Do frequency scan	J	-	Request scan of the max usable bandwidth of the mounted radar front end
Set to max. bandwidth	K	-	Set bandwidth to the scanned maximum
Send Pre-Trigger	L	-	Send pre-trigger for an automatic gain measurement (AGC Mode)
Send Trigger	M	-	Send a trigger for a measurement
Send both Triggers (L, M)	N	-	Send pre-trigger and trigger in one command
Get version info	V	X	Request version info data

3.5 Timing and UART Receive Buffer

There are no timing constraints when sending commands to the kits, however, the UART receive buffer in the kits has a limited size of 128 bytes, which limits the number of commands that can be send in a row. This has to be taken into consideration when sending commands to the kits. Commands are processed after each measurement cycle. If multiple commands need to be sent in a row and their total size exceeds 128 bytes, they have to be split and a part of them has to be sent after the next measurement cycle.

4 WebGUI Output Mode (Default)

Once the SiRad Evaluation Kit is plugged in, it begins sending WebGUI data. Figure 14 shows some of the supported WebGUI data frames and Figure 15 lists their purpose. The data is transmitted in blocks of certain data frames that are tied together in a single transmission, as highlighted in Figure 14. In the figure, two data blocks are marked red. Each data block ends with ASCII value 32 (‘ ‘, space) and additional stop marker and can contain multiple data frames of different size. In the example in Figure 14, the data blocks contain 5 data frames each. One data frame in the upper block is marked blue. Each data frame starts with ASCII value 33 (‘!’) as start marker and ends with two ASCII command characters (‘CR’ and ‘LF’) as stop marker.

The blue parts in Figure 15 indicate start and stop markers and the frame identifier, orange and green parts indicate data parts and grey parts indicate reserved parts that should not be used. Each frame type is recognized by a unique identifier (a certain letter) following the start marker of the frame. The frame types are of different size.

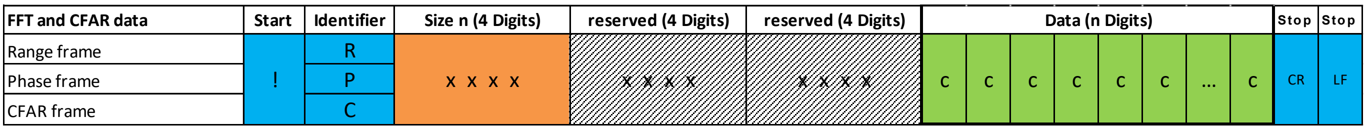
Figure 15 WebGUI Data Frame Formats (Default Communication)

4.1 Magnitude/Range, Phase and CFAR Output

The range frame contains the magnitude output of the FFT, the phase frame contains the argument or phase of the FFT. The CFAR frame contains the output of the CFAR operator that is used to detect targets. The range frame, phase frame and CFAR frame share the same frame formats, please see Figure 16. The start and stop markers and frame identifiers are highlighted in blue, data parts in orange and green color, reserved parts with grey stripes.

The size of this frame depends on the chosen FFT size. A certain FFT size will lead to half of the size of the FFT in the 'Size' field only. The FFT output is mirrored along the magnitude axis, so both parts are added together before the transmission and the length of the transmitted data is only half of the FFT output.



FFT and CFAR data	Start	Identifier	Size n (4 Digits)	reserved (4 Digits)	reserved (4 Digits)	Data (n Digits)								Stop	Stop
Range frame	!	R	x x x x	x x x x	x x x x	c	c	c	c	c	c	...	c	CR	LF

Data (phase frame)	n digits	characters between decimal value 34 and 254	letter 'Z' -> decimal 90	-π to +π rad (-180° to +180°) in 220 steps	34 to 254

4.2 Target Information

The target list contains the targets recognized by the CFAR operator. A target is detected whenever the magnitude of the FFT exceeds the CFAR operator's threshold. The local maximum of that area is marked as a target. The target list's frame format is shown in Figure 17.

The target information is repeated 16 times in the target list. All 16 target information blocks are sent, regardless whether the target blocks are filled with detected targets or not. Empty target information blocks of the list are filled with zeros. Each target information block consists of the 'Target #', 'Distance', 'Magnitude', and 'Phase' fields.

					repeated 16x

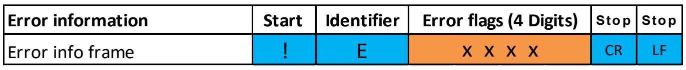
Bandwidth	16 digits	unsigned HEX between '0000' and 'FFFF'	'0200' -> 512	-65536 to 65534 in MHz	'0000' to 'FFFF'
Time diff.	16 digits	unsigned HEX between '0000' and 'FFFF'	'0200' -> 512	0 to 65535 (0 to 0.65535 s)	'0000' to 'FFFF'

4.4 Error Information

The error info frame includes error bits that may be raised temporarily during the signal processing of the radar data and may be removed when changing the settings. This frame will be send by default and can be deactivated by setting 0 to the "ERR" bit in the system configuration command. The 'Error flags' field is transmitted as a 4 byte unsigned HEX number (marked with 'x' in Figure 19). Figure 20 shows the error bits in the 'Error flags' field.



Error information	Start	Identifier	Error flags (4 Digits)	Stop	Stop
Error info frame	!	E	x x x x	CR	LF

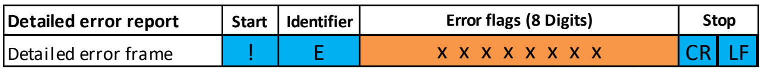
4.5 !E Command – Answer: Detailed Error Report

The detailed error report contains error bits that may be raised temporarily during the signal processing of the radar data and may be removed when changing the settings. This frame contains specific error information, other than the standard Error Information frame explained in Section 4.4, which reports only the processing domains that experience an error.



Detailed error report	Start	Identifier	Error flags (8 Digits)	Stop

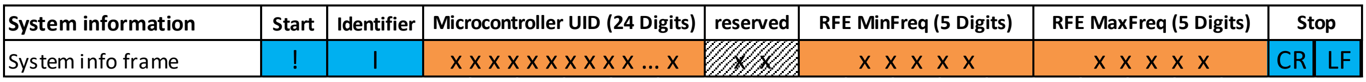
4.6 !I Command – Answer: System Information

The system info frame is used to uniquely identify SiRad Evaluation Kits and return Firmware information.



System information	Start	Identifier	Microcontroller UID (24 Digits)	reserved	RFE MinFreq (5 Digits)	RFE MaxFreq (5 Digits)	Stop	
System info frame	!	I	x x x x x x x x x x ... x	x x	x x x x x	x x x x x	CR	LF

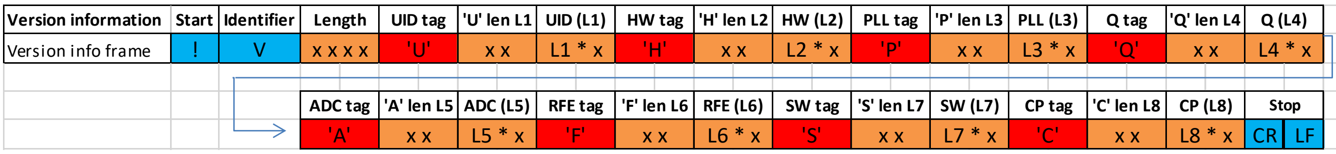
Figure 23 WebGUI System Information Data Frame Format

Table 24 WebGUI System Information Bits

Format Field	Field Size	Encoding	Example	Interpretation	Allowed Values
Microcontroller UID	24 digits	HEX string	'800F0011570A 463332322039'	-	-
RFE MinFreq	5 digits	HEX string between '00000' and 'FFFFF'	'74360	119000 MHz	0 to 524287 MHz
RFE MaxFreq	5 digits	HEX string between '00000' and 'FFFFF'	'7A120	125000 MHz	0 to 524287 MHz

4.7 !V Command – Answer: Version Information

The version frame is used to uniquely identify the SiRad Evaluation Kit and returns information about the hardware and firmware.



Version information	Start	Identifier	Length	UID tag	'U' len L1	UID (L1)	HW tag	'H' len L2	HW (L2)	PLL tag	'P' len L3	PLL (L3)	Q tag	'Q' len L4	Q (L4)
Version info frame	!	V	x x x x	'U'	x x	L1 * x	'H'	x x	L2 * x	'P'	x x	L3 * x	'Q'	x x	L4 * x

ADC tag	'A' len L5	ADC (L5)	RFE tag	'F' len L6	RFE (L6)	SW tag	'S' len L7	SW (L7)	CP tag	'C' len L8	CP (L8)	Stop	
'A'	x x	L5 * x	'F'	x x	L6 * x	'S'	x x	L7 * x	'C'	x x	L8 * x	CR	LF

Figure 24 WebGUI Version Information Data Frame Format (WebGUI Output Format Only)

Table 25 WebGUI Version Information Bits

Format Field	Field Size	Description
Length	4 HEX digits	Length of frame excluding start marker, identifier, length field itself, stop markers
UID tag	1 digit	Indicates start of the microcontroller UID info
UID length	2 HEX digits	Length of the UID field
UID	variable	The microcontroller UID is a unique unsigned HEX number
HW tag	1 digit	Indicates start of the hardware info
HW length	2 HEX digits	Length of the HW field
HW	variable	Baseboard hardware identifier, 'EA' for SiRad Easy®, 'SI' for SiRad Simple®
PLL tag	1 digit	Indicates start of the PLL info
PLL length	2 HEX digits	Length of the PLL field
PLL	variable	PLL chip identifier, '59' for the ADF4159
Q tag	1 digit	Indicates start of the clock info
Q length	2 HEX digits	Length of the Q field
Q	variable	CLK chip identifier
ADC tag	1 digit	Indicates start of the ADC info
ADC length	2 HEX digits	Length of the ADC field
ADC	variable	Operating mode of the ADC, 'I' for interleaved, 'N' non-interleaved
RFE tag	1 digit	Indicates start of the radar front end info
RFE length	2 HEX digits	Length of the RFE field
RFE	variable	Radar front end chip identifier of firmware
SW tag	1 digit	Indicates start of the software / firmware info
SW length	2 HEX digits	Length of the SW field
SW	variable	Firmware version in format: <check-in ID >-<date >-<major>.<minor>.<revision>
CP tag	1 digit	Indicates start of the communication protocol info
CP length	2 HEX digits	Length of the CP field
CP	variable	Protocol version in format: <protocol ID>-<spec date>-<major>.<minor>.<revision>

Table 26 RFE Types

300_030	TRA_300_030

5 TSV Output Mode

Figure 25 shows the supported TSV output frames and Figure 26 lists their purpose. The TSV protocol has a limited set of data frames. When the TSV output is activated, the data is in decimal range. Therefore, the TSV data frames can be configured to transmit the raw data of the ADC. The blue parts in Figure 26 indicate start and stop markers, frame identifiers and delimiters as well as signs, yellow indicates data parts with string numbers of variable length.

The WebGUI output frames for the version info (!V), system info (!I), and the error frames (!E), can be used together with the TSV output mode but there is no TSV representation of these frames. They will be transmitted in WebGUI format, if requested.

Figure 26 TSV Data Frames Overview

5.1 ADC Raw Data (I/Q), Magnitude/Range, Phase and CFAR Output

After the frame's start marker (1 byte) and identifier 'R', 'P' or 'C' (1 byte) follows a frame counter. The frame counter is a 16 bit number starting from 0 and increasing by 1 with each measurement cycle. The frame counter automatically overflows to 0 after reaching the maximum value 65535.

The size field indicates the number of transmitted data points. The ADC raw data frame value range differs depending on the selected processing parameters. If no processing is set (DC cancellation, windowing, FIR filter etc.) the value range is between 0 to +65535, otherwise between -32768 to +32767. The value range of the ADC raw data for 1 ramp is 12 bits (0 to 4096).

The size of the ADC raw data output is always 2 * "Number of Samples" when no down sampling is configured.

5.2 Target Information

The allowed values for the target Magnitude is between -32768 to +32767, however, the typical value range is between -140 to 0 (dB). The frame counter is a 16 bit number starting from 0 and increasing by 1 with each measurement cycle. The frame counter automatically overflows to 0 after reaching the maximum value 65535.

Phase	decimal between -32768 to +32767

5.3 Status Update

In the TSV status update frame, the unit for the maximum range is mm, for the ramp time us, and for the bandwidth MHz. To be able to convert accuracy filed into mm, the data should be divided by 10. If the accuracy field says 271, the system accuracy yields to 27.1 mm. The frame counter is a 16 bit number starting from 0 and increasing by 1 with each measurement cycle. The frame counter automatically overflows to 0 after reaching the maximum value 65535.

6 Binary Output Mode

Figure 30 shows the supported binary format and Figure 31 lists their purpose. The blue parts indicate header and stop markers, purple parts indicate data blocks, length of the data and frame identifier (Chn).

The WebGUI output frames for the version info (!V), system info (!I), and the detailed error report (!E), can be used together with the TSV output mode but there is no TSV representation of these frames. They will be transmitted in WebGUI format, if requested.

Time diff.	2 bytes	Unsigned Integer	0 to 65535

6.4 Error Information

The error info frame includes error bits that may be raised temporarily during the signal processing of the radar data and may be removed when changing the settings. This frame will be send by default and can be deactivated by setting 0 to the “ERR” bit in the system configuration command. Error Flags contains the same error bits for error domains as explained in Section 4.4, where the WebGUI error information frame is explained.
